DESCRIPTION

General

The 2 channel, 2.5 GSPS, DAx22000 is a highly versatile PC controlled Arbitrary Waveform Generator. It incorporates many advanced features such as programmable segment sizes, looping, and individual segment triggering. Since the data downloaded to the card can be arbitrary almost any waveform that the user can imagine can be created. Whether it be random noise, a custom shaped pulse, a pure sine wave, a modulated subcarrier, or an encoded radar signature, the DAx22000 will faithfully reproduce it.

The high speed D/A converter (DAC) can be clocked internally or externally (opt.). Because the DAC is only running at half of its maximum clock rate of 5.0 GHz, the signal quality is exceptional. Most products in the AWG market are usually running at their maximum clock rates at reduced quality to meet marketing goals.

Triggering

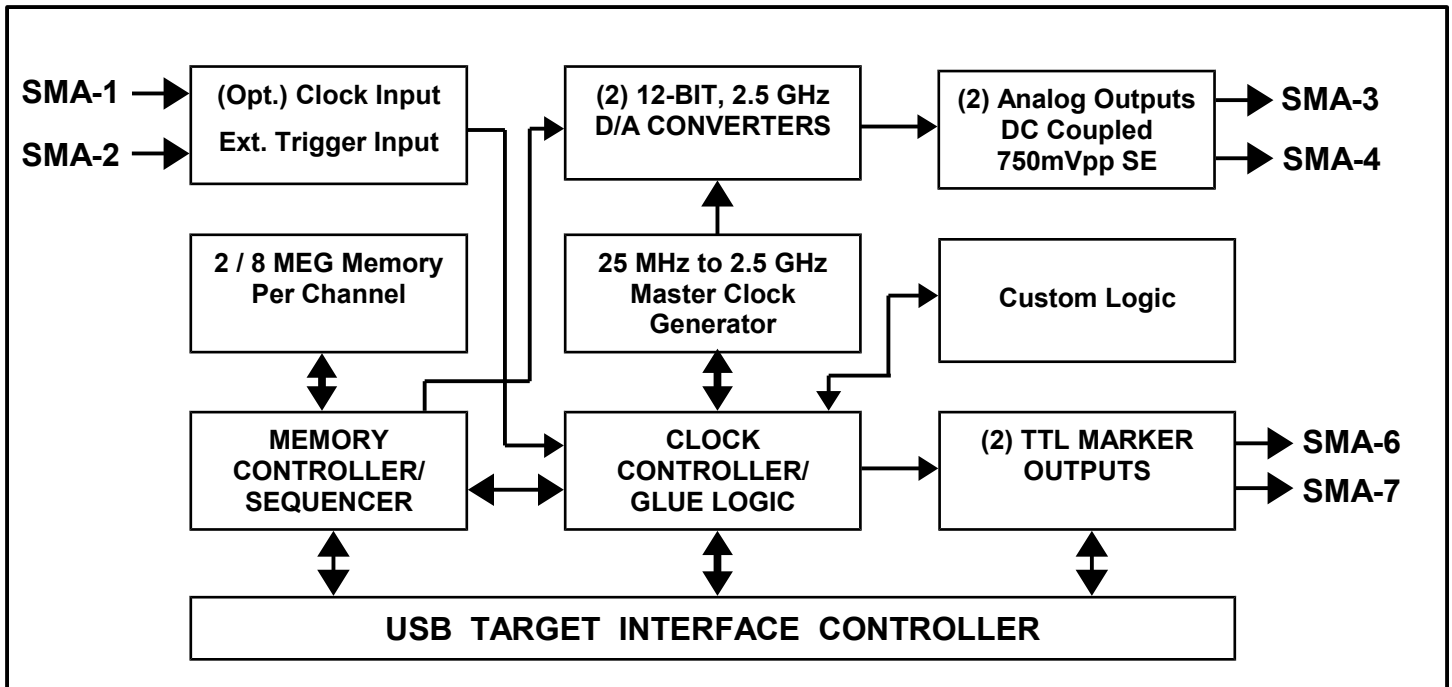

The DAx22000 board can be triggered by a TTL signal, pulsed PECL, or software command. Looping can be set for continuous or under user program control.

Memory

The DAx22000 comes standard with 2 Mega-Samples (8MS optional) of independent memory PER channel. Segment size controls are common to both channels.

GUI Interface and SDK

The DAx22000 comes with a GUI program that can perform tasks like loading waveforms from a file to generating sine / square / and triangle waves, changing clock rates, triggering etc. The user programming interface for the DAx22000 is a simple DLL that uses C type software calls that are compatible with most software development tools.
